

## Virtual Power Plant

**At homes and buildings across the country,** Blue Link systems connect to the grid, adding clean electricity whenever the sun shines. Together, these systems form Blue Link Solar Network, a Virtual Power Plant, with generation equipment distributed around the country. Clean electricity produced by Blue Link Solar Network decreases output from polluting, unsustainable fossil fuel power plants. As the network grows and produces clean electricity, the network page tracks electricity production, environmental benefits, and the community that makes it possible.
